

- The customer table has the primary key of customer\_id so that it may be used elsewhere
- The customer table also has a relationship to none or many concessions.
- The customer table has a zero to many tickets because one customer may purchase none or several tickets
- The tickets table has a primary key named ticket\_id because that may be important to use as a foreign key on another table to record purchases
- the ticket table has a mandatory one to one relationship to the movies table, one ticket is equal to one movie.
-
